General Information

Description

FAIR Software Solutions is a startup that aims to develop software solutions geared towards facilitating the distribution and sale of food products, in the context of the 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015, which comprises 17 Sustainable Development Goals (https://ods.pt/ods/).

FAIR Software Solutions has recently identified a business opportunity in the AMAP/CSA field. For this reason, it is considering developing a solution for this market and is looking for a highly motivated team to specify the functional and non-functional requirements for this software solution, covering all of its processes.

An AMAP[1] (***Association for the Maintenance of Local Farming***) and **CSA** (***Community Supported Agriculture)*** are two names for a common goal: consumers and producers united by growing healthy food and by a more dignified life for those who produce what feeds us in a sustainable, ecosystem-

[1] https://amap.movingcause.org/

regenerating way. An **AMAP** or **CSA**, is formed by a group of consumers who actively and directly support one or more farmers and producers, ensuring the distribution of their produce.

Method

The assignment must follow the requirements elicitation methodology presented in the course unit; all techniques are valid and may be used in combination with one another.

Whenever possible, requirements elicitation sessions with stakeholders will be conducted with real stakeholders (sessions taking place during T classes), complemented by documentary analysis, research into relevant sources, and some simulated sessions during PL classes, in which case the lecturers will play the roles of the different client stakeholders.

Given the constraints of the *stakeholders* of FAIR-AMAP, sessions must be scheduled individually (usually during practical classes). The FAIR director is only available to attend the initial project presentation.

The progress of the work must be recorded in the repository (planning, meetings, tasks, artefacts, etc.).

The work is done in groups (4 or 5 students).

Presentation and Submission

Materials

The final result must be submitted in the form of a document (an SRS, for which a template will be provided as an example) reflecting the full specification, the process used, and any other artefacts considered relevant. Some examples are given below:

- General description of the system;
- System functionalities;
- External interfaces;

Commented [BM1]: Alterava este paragrafo para investigação documental e pesquisa. Penso que estamos a dar muito foco nisto se sabemos que será diferente este ano.
Diria:
Complementadas com análise documental, pesquisa de fontes relevantes e algumas sessões simuladas duranta as aulas PL...

Commented [BM2]: Referir SRS, cujo template será partilhado?
Referir que também deverão ser demonstradas as técnicas utilizadas e respetivas evid-encias?

- Other non-functional requirements;
- Priorities;
- Estimate, in hours, for the development of each functionality;
- Regarding the process, it is important to describe the method used, including the techniques applied and their supporting evidence, context, and time allocated to each *business analyst* / task.

Submission deadline

Submission location

Moodle.

Presentation

Assessment

Criteria:

This part of the project will be assessed by the lecturer responsible for the course unit, based on the presentation, the process used, and an analysis of the artefacts submitted by the students.

The assessment and feedback process will take into account the knowledge and skills achieved in relation to the following objectives:

1- Specify and analyse requirements for a software solution;

2- Work as a team, plan and manage the project, and communicate and document their activity.
